Chapter 1

C Data Structure Library: Stack Library

Version

0.2.1

Author

Jun Woong (woong.jun at gmail.com)

Date

last modified on 2013-04-23

1.1 Introduction

This document specifies the Stack Library which belongs to the C Data Structure Library. The basic structure is from David Hanson's book, "C Interfaces and Implementations." I modified the original implementation to enhance its readability, for example a prefix is used more strictly in order to avoid the user namespace pollution.

Since the book explains its design and implementation in a very comprehensive way, not to mention the copyright issues, it is nothing but waste to repeat it here, so I finish this document by giving introduction to the library; how to use the facilities is deeply explained in files that define them.

The Stack Library reserves identifiers starting with `stack_` and `STACK_`, and imports the Assertion Library (which requires the Exception Handling Library) and the Memory Management Library.

1.2 How to Use The Library

The Stack Library is a typical implementation of a stack based on a linked list. Even if its implementation is very similar to the List Library, the implementation details are

hidden behind an abstract type called `stack_t` because, unlike lists, revealing the implementation of a stack hardly brings benefit. The storage used to maintain a stack itself is managed by the library, but any storage allocated for data stored in a stack should be managed by a user program.

Similarly for other data structure libraries, use of the Stack Library follows this sequence: create, use and destroy.

If functions that allocate storage fail memory allocation, an exception `mem_exceptfail` is raised; therefore functions never return a null pointer.

1.3 Boilerplate Code

Using a list starts with creating it. There is only one function provided to create a new stack, `stack_new()`. Calling it returns a new and empty stack.

Once a stack has been created, you can push data into or pop it from a stack using `stack_push()` and `stack_pop()`, respectively. `stack_peek()` also can be used to see what is stored at the top of a stack without popping it out. Because popping an empty stack triggers an exception `assert_exceptfail`, calling `stack_empty()` is recommended to inspect if a stack is empty before applying `stack_pop()` to it.

`stack_free()` destroys a stack that is no longer necessary, but note that any storage that is allocated by a user program does not get freed with it; `stack_free()` only returns back the storage allocated by the library.

As an example, the following code creates a stack and pushes input characters into it until EOF encountered. After that, it prints the characters by popping the characters and destroy the stack.

```
int c;
char *p, *q;
stack_t *mystack;

mystack = stack_new();
while ((c = getc(stdin)) != EOF) {
    MEM_NEW(p);
    *p = c;
    stack_push(mystack, p);
}

while (!stack_empty(mystack)) {
    p = stack_peek(mystack);
    q = stack_pop(mystack);
    assert(p == q);
    putchar(*p);
    MEM_FREE(p);
}
putchar('\n');

stack_free(&mystack);
```

where `MEM_NEW()` and `MEM_FREE()` come from the Memory Management Library.

Note that before invoking `stack_pop()`, the stack is checked whether empty or not by

`stack_empty()` and that when popping characters, the storage allocated for them gets freed.

1.4 Future Directions

No future change on this library planned yet.

1.5 Contact Me

Visit <http://code.woong.org> to get the latest version of this library. Only a small portion of my homepage (<http://www.woong.org>) is maintained in English, thus one who is not good at Korean would have difficulty when navigating most of other pages served in Korean. If you think the information you are looking for is on pages written in Korean, do not hesitate to send me an email to ask for help.

Any comments about the library are welcomed. If you have a proposal or question on the library just email me, and I will reply as soon as possible.

1.6 Copyright

I do not wholly hold the copyright of this library; it is mostly held by David Hanson as stated in his book, "C: Interfaces and Implementations:"

Copyright (c) 1994,1995,1996,1997 by David R. Hanson.

Permission is hereby granted, free of charge, to any person obtaining a copy of this software and associated documentation files (the "Software"), to deal in the Software without restriction, including without limitation the rights to use, copy, modify, merge, publish, distribute, sublicense, and/or sell copies of the Software, and to permit persons to whom the Software is furnished to do so, subject to the following conditions:

The above copyright notice and this permission notice shall be included in all copies or substantial portions of the Software.

For the parts I added or modified, the following applies:

Copyright (C) 2009-2013 by Jun Woong.

This package is a stack implementation by Jun Woong. The implementation was written so as to conform with the Standard C published by ISO 9899:1990 and ISO 9899:1999.

stack.h	Documentation for Stack Library (CDSL)	10

Chapter 3

File Documentation

3.1 stack.c File Reference

Source for Stack Library (CDSL)

```
#include <stddef.h> #include "cbl/assert.h" #include "cbl/memory.-  
h" #include "stack.h" Include dependency graph for stack.c:
```

Functions

- `stack_t *()` `stack_new` (void)
creates a stack.
- `int()` `stack_empty` (const `stack_t` *stk)
inspects if a stack is empty.
- `void()` `stack_push` (`stack_t` *stk, void *data)
pushes data into a stack.
- `void *()` `stack_pop` (`stack_t` *stk)
pops data from a stack.
- `void *()` `stack_peek` (const `stack_t` *stk)
peeks the top-most data in a stack.
- `void()` `stack_free` (`stack_t` **stk)
destroys a stack.

3.1.1 Detailed Description

Source for Stack Library (CDSL)

3.1.2 Function Documentation

3.1.2.1 `int() stack_empty (const stack_t * stk)`

inspects if a stack is empty.

[`stack_empty\(\)`](#) inspects if a stack is empty.

Possible exceptions: `assert_exceptfail`

Unchecked errors: foreign data structure given for `stk`

Parameters

<code>in</code>	<code>stk</code>	stack to inspect
-----------------	------------------	------------------

Returns

whether stack is empty or not

Return values

<code>1</code>	empty
<code>0</code>	not empty

3.1.2.2 `void() stack_free (stack_t ** stk)`

destroys a stack.

[`stack_free\(\)`](#) deallocates all storages for a stack and set the pointer passed through `stk` to a null pointer. Note that [`stack_free\(\)`](#) does not deallocate any storage for the data in the stack to destroy, which must be done by a user.

Possible exceptions: `assert_exceptfail`

Unchecked errors: foreign data structure given for `stk`

Warning

The storage allocated for data (whose address a stack's node possesses) is never touched; its allocation and deallocation is entirely up to the user.

Parameters

<code>in, out</code>	<code>stk</code>	pointer to stack to destroy
----------------------	------------------	-----------------------------

Returns

nothing

3.1.2.3 `stack_t*() stack_new (void)`

creates a stack.

[stack_new\(\)](#) creates a new stack and sets its relevant information to the initial.

Possible exceptions: `mem_exceptfail`

Unchecked errors: none

Returns

created stack

3.1.2.4 `void*() stack_peek (const stack_t * stk)`

peeks the top-most data in a stack.

[stack_peek\(\)](#) provides a way to inspect the top-most data in a stack without popping it up.

Possible exceptions:

Unchecked errors:

Parameters

<code>in</code>	<code>stk</code>	stack to peek
-----------------	------------------	---------------

Returns

top-most data in stack

3.1.2.5 `void*() stack_pop (stack_t * stk)`

pops data from a stack.

[stack_pop\(\)](#) pops data from a stack. If the stack is empty, an exception is raised due to the assertion failure, so popping all data without knowing the number of nodes remained in the stack needs to use [stack_empty\(\)](#) to decide when to stop.

Possible exceptions: `assert_exceptfail`

Unchecked errors: foreign data structure given for `stk`

Parameters

<code>in, out</code>	<code>stk</code>	stack from which data popped
----------------------	------------------	------------------------------

Returns

data popped from stack

3.1.2.6 void() `stack_push` (`stack_t` * *stk*, void * *data*)

pushes data into a stack.

`stack_push()` pushes data into the top of a stack. There is no explicit limit on the maximum number of data that can be pushed into a stack.

Possible exceptions: `mem_exceptfail`, `assert_exceptfail`

Unchecked errors: foreign data structure given for *stk*

Parameters

<i>in, out</i>	<i>stk</i>	stack into which given data pushed
<i>in</i>	<i>data</i>	data to push

Returns

nothing

3.2 `stack.h` File Reference

Documentation for Stack Library (CDSL)

This graph shows which files directly or indirectly include this file:

Typedefs

- typedef struct `stack_t` `stack_t`
represents a stack.

Functions

stack creating and destroying functions:

- `stack_t` * `stack_new` (void)
creates a stack.
- void `stack_free` (`stack_t` **)
destroys a stack.

data handling functions:

- void `stack_push` (`stack_t` *, void *)
pushes data into a stack.
- void * `stack_pop` (`stack_t` *)
pops data from a stack.
- void * `stack_peek` (const `stack_t` *)
peeks the top-most data in a stack.

misc. functions:

- int [stack_empty](#) (const [stack_t](#) *)
inspects if a stack is empty.

3.2.1 Detailed Description

Documentation for Stack Library (CDSL) Header for Stack Library (CDSL)

3.2.2 Function Documentation**3.2.2.1 int [stack_empty](#) (const [stack_t](#) * *stk*)**

inspects if a stack is empty.

[stack_empty\(\)](#) inspects if a stack is empty.

Possible exceptions: `assert_exceptfail`

Unchecked errors: foreign data structure given for `stk`

Parameters

<code>in</code>	<code>stk</code>	stack to inspect
-----------------	------------------	------------------

Returns

whether stack is empty or not

Return values

<code>1</code>	empty
<code>0</code>	not empty

3.2.2.2 void [stack_free](#) ([stack_t](#) ** *stk*)

destroys a stack.

[stack_free\(\)](#) deallocates all storages for a stack and set the pointer passed through `stk` to a null pointer. Note that [stack_free\(\)](#) does not deallocate any storage for the data in the stack to destroy, which must be done by a user.

Possible exceptions: `assert_exceptfail`

Unchecked errors: foreign data structure given for `stk`

Warning

The storage allocated for data (whose address a stack's node possesses) is never touched; its allocation and deallocation is entirely up to the user.

Parameters

<code>in, out</code>	<code>stk</code>	pointer to stack to destroy
----------------------	------------------	-----------------------------

Returns

nothing

3.2.2.3 `stack_t* stack_new (void)`

creates a stack.

[stack_new\(\)](#) creates a new stack and sets its relevant information to the initial.

Possible exceptions: `mem_exceptfail`

Unchecked errors: none

Returns

created stack

3.2.2.4 `void* stack_peek (const stack_t * stk)`

peeks the top-most data in a stack.

[stack_peek\(\)](#) provides a way to inspect the top-most data in a stack without popping it up.

Possible exceptions:

Unchecked errors:

Parameters

<code>in</code>	<code>stk</code>	stack to peek
-----------------	------------------	---------------

Returns

top-most data in stack

3.2.2.5 `void* stack_pop (stack_t * stk)`

pops data from a stack.

[stack_pop\(\)](#) pops data from a stack. If the stack is empty, an exception is raised due to the assertion failure, so popping all data without knowing the number of nodes remained in the stack needs to use [stack_empty\(\)](#) to decide when to stop.

Possible exceptions: `assert_exceptfail`

Unchecked errors: foreign data structure given for `stk`

Parameters

<i>in, out</i>	<i>stk</i>	stack from which data popped
----------------	------------	------------------------------

Returns

data popped from stack

3.2.2.6 void stack_push (stack_t * *stk*, void * *data*)

pushes data into a stack.

[stack_push\(\)](#) pushes data into the top of a stack. There is no explicit limit on the maximum number of data that can be pushed into a stack.

Possible exceptions: mem_exceptfail, assert_exceptfail

Unchecked errors: foreign data structure given for *stk*

Parameters

<i>in, out</i>	<i>stk</i>	stack into which given data pushed
<i>in</i>	<i>data</i>	data to push

Returns

nothing
